With the receiver switched on, whilst pressing the **UP** & **DOWN** keys simultaneously, press the **RCL** key once. The frequency display should then show 0.345 MHz. Now tune the radio to a known receive frequency such as 0.909 MHz AM and press the **MEM** button to store the frequency in memory. These operations in the sequence described will reset the microprocessor and the radio can be used as normal.

If the receiver is subjected to external influences such as **Static Interference** or receives a **Power Surge** on the mains power, it is possible that the microprocessor may be upset. The evidence of this will be an apparent loss of receive capability and the display reading erratically whilst the tuning knob is being turned.

MICROPROCESSOR RESET FACILITY

The above supersedes the paragraph on page 12, "The HF3 has no facility for external audio output". The impedance of the accessory being used. If unsure ring for advice.

The **TARGET HF3** Receiver manufactured by **AKD** has a headphone socket mounted on the rear panel as shown in the drawing above. This socket is a 3.5mm type and the speaker is muted when in use. The impedance is 8 Ω minimum. Do not plug into this socket without establishing the

HEADPHONE SOCKET
